The global Conductive Polymer Ammonia Monitoring Sensor market size is predicted to grow from US$ 354 million in 2025 to US$ 446 million in 2031; it is expected to grow at a CAGR of 3.9% from 2025 to 2031.

Conductive polymer monitoring ammonia sensor is a gas sensor based on conductive polymer materials, which is specially used to detect the ammonia concentration in the environment. The working principle of the conductive polymer ammonia sensor mainly relies on the interaction between the conductive polymer and the ammonia molecules. When the ammonia molecules come into contact with the conductive polymer, an electron donation relationship will occur between them, causing the conductivity of the polymer to change. This change in conductivity can be detected and measured by electrical signals to determine the concentration of ammonia in the environment.
