A conductive rubber sheet is a sheet or mat made of rubber compounded with a special material that conducts electricity.

Silicon rubber is made from a compound containing silicon, which is an insulator and does not conduct electricity easily. Therefore, conductive rubber sheets are made by compounding a large amount of conductors into synthetic or natural rubber, such as silicon rubber, which has insulating properties, to give conductivity to silicon rubber, which does not conduct electricity.

Furthermore, by changing the rubber material, it is possible to add features such as weather resistance, heat resistance, and chemical resistance. Therefore, selecting conductive rubber that is made of suitable materials for the intended use can provide higher conductivity effects.

The global Conductive Rubber Sheet market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
