Low-temperature co-fired ceramic substrate technology (LTCC) is a high-density integrated packaging technology, and the conductive silver paste therein is one of the key raw materials for preparing high-reliability electronic components. Its composition and performance have a great influence on the conductivity and welding performance of the thick film after sintering, as well as the co-firing matching with the substrate.

Silver paste is an important raw material for LTCC devices. It is combined with ceramic substrates through screen printing and has the advantages of good conductivity and low loss. It is composed of silver powder, glass powder, organic additives, etc. Among them, silver powder is the component with the highest cost share of silver paste and is also the component that most affects the performance of silver paste.
