The global Conductive Thermal Interface Material market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Conductive Thermal Interface Material (TIM) is a specialized substance used to enhance the thermal connection between two surfaces, typically between a heat-generating component, like a microprocessor or power transistor, and a heat sink or spreader. These materials are designed to fill microscopic air gaps and irregularities on the surfaces, which can impede efficient heat transfer. By providing a conductive path, TIMs improve the thermal conductivity, allowing heat to dissipate more effectively from the component to the heat sink, thereby preventing overheating and ensuring optimal performance and longevity of the device. Conductive TIMs are commonly made from materials such as silicone, graphite, metal oxides, or phase change materials, often infused with thermally conductive particles. They are widely used in electronics, automotive, and aerospace industries, where efficient thermal management is crucial for the reliability and performance of high-power and heat-sensitive devices.

United States market for Conductive Thermal Interface Material is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
