The global Conical Twin Screw market size is predicted to grow from US\$ 58.70 million in 2025 to US\$ 80.39 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

The conical twin screw is a core component of an anti-rotating twin-screw extruder. Its key feature is that the outer and root diameters of the two screws gradually decrease in a conical shape from the feeding section to the discharge end, and the inner cavity of the barrel also has a corresponding conical shape. Its core design concept utilizes the gradual change in volume to achieve a gentle, controllable, and efficient compression, plasticization, and pressure-building process for materials, making it particularly suitable for processing heat-sensitive, high-viscosity, and difficult-to-feed loose materials.

Demand stems directly from the downstream industries of PVC products (such as door and window profiles and pipes), wood-plastic composites, and some thermoplastic elastomers (TPEs) that require stable and efficient processing of heat-sensitive powdery and fibrous raw materials. Upstream suppliers provide special alloy steel, bimetallic composite materials, and high-precision CNC machine tools, offering the wear-resistant and corrosion-resistant materials and processing capabilities needed to manufacture the screws. Downstream applications are directly used in specific extrusion equipment such as PVC profile extrusion production lines, wood-plastic flooring production lines, and cable material granulation lines, ultimately serving the construction, decoration, packaging, and infrastructure sectors. In 2025, the production volume of conical twin screw will be approximately 20,000 sets, with an average price of approximately US\$3,000 per set, a gross profit margin of approximately 40%, and a single-line capacity of 300 sets per year.
