The global Conjugated Polymer market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Conjugated polymers are a special class of organic polymers whose molecular structure contains repeating units with conjugated electron systems. The conjugated electron system means that adjacent π -bonds and π -electrons can form a continuous conjugated structure, thereby expanding the distribution of electronic energy levels.

The characteristics of conjugated polymers: good optical properties, high electrical conductivity, structural diversity, good processability and plasticity. By rationally designing and adjusting the structure of conjugated polymers, more efficient photoelectric conversion, higher electrical conductivity, and a wider range of applications can be achieved.
