The global Constant Force Actuator (ACF-Kit) market size is predicted to grow from US\$ 363 million in 2025 to US\$ 579 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

The constant force actuator is a precision automation equipment, and its core function is to always maintain a relatively stable and constant contact force during the working process. This contact force is the pressure applied by the end tool of the actuator (such as grinding head, polishing head, etc.) when it contacts the surface of the workpiece. In the process of grinding, polishing and other processing, the "constant force" characteristic of the constant force actuator is crucial because it can ensure the consistency and stability of the processing effect, prevent the surface of the workpiece from being damaged due to excessive contact force, or fail to achieve the expected processing effect due to too small contact force. Through its internal mechanical structure and control system, the constant force actuator can automatically adjust and maintain a set force value, and maintain the stability of the force even when the workpiece size deviation, surface attachments or other changes occur, thereby improving the processing quality and efficiency. The actuator is installed between the robot and the grinding tool to achieve flexible contact between the grinding tool and the workpiece driven by the robot, which is equivalent to installing a constant force "spring" between the tool and the robot, ensuring that it is automatically compressed to avoid collision when the trajectory has abnormal protrusions or high points, and automatically extended when the trajectory has abnormal depressions or the abrasive wears, so that the tool always fits stably with the surface of the workpiece.
