Globally construction is regarded as one of the major source of generating pollution. Various sustainable materials have been identified to replace the existing construction materials in order to save energy, water and various non-renewable resources. Quick shift towards the sustainable construction is profitable for the companies in order to avoid imposition of any regulations in future. Construction industry uses more than 500 million tons of materials causing adverse impact on the environment. Construction industry causes 23.0% of air pollution, 40.0% of the water pollution, 50.0% of the landfill wastes and 50.0% of the climate change. To this impact, many construction companies have changed their methods that globally there are 230,000 buildings in harmony with the environment. For instance, use of bamboo as a construction material has proved to be very strong and durable material for flooring as well as making walls and roof along with various other applications.
