In lithium batteries, binders can be divided into positive electrode binders and negative electrode binders. According to the dispersion system of binders, they can be further divided into oil-based binders and water-based binders. The typical representative of oil-based binders is PVDF, while water-based binders include CMC, SBR, PAA, etc. At present, 90% of positive electrode binders are mainly PVDF, which shows the best comprehensive performance. However, the solvent used in it, NMP, has a reproductive toxicity risk. The European Union has introduced relevant policies to restrict the use of NMP. Therefore, material and battery companies are actively developing water-based binders that are cheaper, more environmentally friendly, and have the same excellent performance to replace oil-based PVDF. The existing water-based binders on the market may have some performance issues when used on the positive electrode. The extreme binder is mainly water-based, including SBR (styrene butadiene lotion), CMC (hydroxymethyl cellulose), PTFE (polytetrafluoroethylene lotion), PAA (polyacrylate), etc. Compared with organic solvent based adhesives, water-based adhesives have the advantages of only volatile water vapor, green production environment, low cost, and non flammability, making them an important development direction for key materials in lithium batteries.
