The global Consumer-Grade On-Device AI Glasses market size is predicted to grow from US\$ 1372 million in 2025 to US\$ 5524 million in 2032; it is expected to grow at a CAGR of 20.7% from 2026 to 2032.

Consumer-grade on-device AI glasses are lightweight, smart wearable devices designed for individual users that integrate AI processing capabilities directly into the hardware; they enable intelligent functions?such as voice assistants, real-time translation, visual recognition, navigation guidance, and health monitoring?without relying on a continuous cloud connection. In 2025, global Consumer-Grade On-Device AI Glasses production reached approximately 3894 k units, with an average global market price of around 360 US\$/Unit.

The upstream segment of the consumer-grade on-device AI glasses industry chain primarily encompasses low-power AI chips/NPUs, camera modules, microphone arrays, open-ear speakers, optical waveguide/MicroLED display modules, sensors, battery and charging modules, flexible circuit boards, lenses, frames, structural components, speech recognition algorithms, multimodal AI models, and operating systems. The midstream consists mainly of AI eyewear design, optical-display integration, on-device algorithm adaptation, system software development, ODM/OEM manufacturing, and branded device manufacturers. The downstream market primarily targets general consumers, content creators, business professionals, travelers, sports and outdoor enthusiasts, and light-duty office users.

Consumer-grade on-device AI glasses are currently in a phase of rapid market entry and early-stage volume growth. Product designs primarily feature either non-display AI glasses or lightweight display-equipped models, with core functions centered on first-

person perspective (FPP) capture, AI voice assistants, image recognition, real-time translation, meeting transcription, navigation alerts, content creation, and daily information retrieval. The market is currently dominated by edge-cloud collaborative solutions; the glasses themselves handle functions such as camera, microphone, speaker, and sensor operations, low-power processing, and user interaction, while complex large-model inference is largely performed by smartphones or the cloud. However, as technologies mature—including low-power AI chips, on-device NPUs, camera modules, microphone arrays, voice noise reduction, MicroLED/waveguide displays, and local small-scale models—more AI capabilities are migrating directly to the glasses. Market growth is driven by factors such as the widespread adoption of generative AI applications, increasing consumer acceptance of portable AI assistants, rising demand for short-video and FPP content creation, growing needs for real-time translation in cross-border travel and business, accelerated market entry by smartphone manufacturers and internet platforms, and improvements in the lightweight design and wearing comfort of AI glasses. Looking ahead, consumer-grade on-device AI glasses are poised to evolve from simple capture-and-query devices into next-generation wearable AI terminals that integrate visual perception, voice interaction, real-time prompts, personal memory, content generation, and context-aware services.
