The report requires updating with new data and is sent in 48 hours after order is placed.

For large semiconductor manufacturers, they have the core competence to manufacture this product line. The first is MEMS design and manufacturing capabilities, followed by ASIC design and manufacturing capabilities, and finally the large-capacity, low-cost packaging capabilities. So far, audio companies have occupied almost the entire MEMS microphone market, they must rely on semiconductor foundries to provide related technologies and share profits with them. Now, the entry of Infineon means that the market has new options and reduces the risk of component buyers.

The size limitation mainly comes from MEMS itself. In addition, because the audio port cannot be operated with vacuum tools, further size reduction will be limited by standard automated placement tools in the manufacturing process.

More functions will be integrated in the ASIC: and digital output is the first step; standard components such as wind noise signal filtering components can also be used; dedicated interfaces and signal preprocessing will become a large application area; RF shielding will also be further Improve.

In terms of audio, MEMS microphones will also have many changes. SMM310 is not only optimized for human voice in the frequency range of 20Hz~20kHz, but also has high acoustic sensitivity.
