Contact lenses for achromatopsia are specialized tinted lenses designed to aid individuals with achromatopsia—a rare, inherited visual disorder characterized by the absence or malfunction of cone photoreceptors in the retina. This condition results in complete color blindness, extreme light sensitivity (photophobia), poor visual acuity, and difficulty seeing in bright environments. These contact lenses work primarily by filtering specific wavelengths of light, particularly in the blue and ultraviolet spectrum, thereby reducing glare and enhancing contrast. Unlike standard corrective lenses that improve refractive errors, contact lenses for achromatopsia are therapeutic and aim to improve visual comfort and functional vision rather than restore color perception. They are typically customized to each patient's needs and can significantly enhance day-to-day visual experiences, especially in well-lit conditions.
