A container overheight frame is a frame structure specially designed to support and transport super high containers. Some goods or equipment require the use of overheight containers (usually higher than 9 feet 6 inches or 2.9 meters). Since these containers are higher than the conventional standards, special frames are needed to carry and transport them. The overheight frame provides enough space by increasing the structural height of the bottom of the container or using a heightened frame to ensure that the overheight container can be transported safely and securely. It not only supports the weight of the overheight container, but also ensures that the height limit of transportation is not exceeded during transportation.
