A container refrigeration unit, also known as a reefer unit or simply a reefer, is a specialized piece of equipment used to control the temperature and humidity inside shipping containers. It is commonly used for transporting perishable goods, such as fruits, vegetables, meat, seafood, and pharmaceutical products, over long distances.

The container refrigeration unit is typically mounted on the front exterior wall of a shipping container and is designed to maintain the desired temperature range throughout the transportation process. It works by using a compressor, condenser, evaporator, and a refrigerant to extract heat from the container's interior and expel it outside. The refrigerant is circulated through a closed system, undergoing phase changes to absorb heat from the container and release it outside, thereby cooling the container's contents.

The temperature inside a container refrigeration unit can be adjusted based on the specific requirements of the cargo being transported. The unit is equipped with controls and sensors to monitor and regulate temperature, humidity, airflow, and other parameters to ensure optimal conditions for the cargo. It can be powered by different sources, such as diesel generators, electric power from the shipping vessel, or external power sources on land.
