Applications, like any other system, require certain basic components in order to function properly. It is often difficult to take software and find a way to use it on a platform other than the one that it is originally designed for. Containers exist for just this reason. They enable software developers to create programs that can circumvent challenges that exist in running cross-platform programs. In essence, containers are a type of software that contain all the elements necessary to running applications across

multiple environments. Programmers who take this approach, and avoid unwittingly holding back their applications, create versatile systems. When properly utilized, this option becomes an invaluable tool to those who create systems that may be required to cross over into other environments.
