Container Vulnerability Scanning is a security practice that involves scanning and assessing the vulnerabilities present in containerized environments. Containers are lightweight, isolated software packages that encapsulate applications and their dependencies. However, just like any other software, containers can also have security vulnerabilities that can be exploited by malicious actors. Container Vulnerability Scanning involves using specialized tools and software to scan container images and identify any known security vulnerabilities. The scanning process typically involves comparing the container image against a database of known vulnerabilities, which is regularly updated with the latest security information.
