According to this study, the global Continue Casting Direct Rolling Line market size will reach US\$ 648 million by 2031.

Continue Casting Direct Rolling Line, often abbreviated as CCDR or similar terms, is a manufacturing process used in the steel industry that combines continuous casting and direct rolling. This technique is designed to improve efficiency and reduce production costs by eliminating the need for intermediate stages typically found in traditional manufacturing processes.

Continuous Casting is the initial phase in which molten metal, usually steel, is poured into a mold to create semi-finished products like slabs, billets, or blooms. The continuous casting process allows for the continuous flow of molten steel, which solidifies into a shape as it cools down while being drawn out of the mold. Instead of further processing the cast product into a more easily manageable form (like reheating slabs or billets before rolling), the cast products are directly fed into a rolling mill. This reduces or eliminates the need for intermediate heating and handling, thereby enhancing productivity. The direct rolling process can improve the mechanical properties of the final product due to minimal thermal cycles, leading to finer microstructure.
