The continuous airflow driven turbine motor is a pneumatic device that uses a stable and continuous compressed air flow to drive the turbine blades to rotate, thereby outputting mechanical energy. The motor drives the impeller to rotate at high speed through high-pressure gas, does not rely on electricity or fuel, and has the characteristics of fast response, compact structure, and good heat dissipation. Its turbine structure can achieve long-term stable operation under the action of continuous airflow. It is suitable for equipment that requires high speed, light load, and spark-free working environment, such as precision tools, automated machinery, aviation equipment, and explosion-proof occasions. It is one of the important components for achieving safe and efficient pneumatic drive.
