The global Continuous Catalytic Reforming Reactor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A continuous catalytic reforming reactor is a device used in the oil refining process to convert oil feedstocks (such as naphtha) into high-octane gasoline components and aromatic compounds through catalytic reforming reactions. The design of the reactor allows the catalyst to operate continuously in the reactor and be regenerated through a built-in regeneration system to maintain the activity and reaction efficiency of the catalyst. The reactor usually operates at high temperature and pressure, and the reaction conditions are controlled to optimize the quality and yield of the product. The continuous catalytic reforming reactor is one of the key equipment in the petrochemical field, supporting efficient continuous production processes.
