The Continuous Flow Rotor System is a centrifugal device used for laboratory analysis and biochemical research, which is used to separate and analyze samples under high-speed rotation conditions.

In the continuous flow rotation system, the sample is injected into the rotating centrifuge through a continuous flow system, and then under the centrifugal force of high-speed rotation, the different components in the sample are separated according to their density or size. This system is often used to quickly separate and analyze a large number of samples, such as blood, cell culture, protein solutions, etc.

The Continuous Flow Rotor System can achieve efficient sample processing and analysis, which helps to accelerate the progress of experiments and research, and can also be applied to clinical diagnosis, biopharmaceuticals, genomics and other fields.

The global Continuous Flow Rotor System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
