Continuous Flow Ultracentrifuge System is a device used for high-speed separation and purification of biomolecules (such as proteins, DNA, RNA, etc.). It uses centrifugal force to separate biomolecules in solution according to their density and size, thereby achieving sample separation and enrichment.

Unlike traditional desktop ultracentrifuges, the Continuous Flow Ultracentrifuge System uses continuous sampling and continuous centrifugation to achieve high-efficiency, high-throughput biological separation and purification. Usually used in biochemistry, biomedicine, biopharmaceutical and other fields where large-scale production and efficient purification of biomolecules are required. It has the characteristics of high speed, efficiency and automation, can quickly process a large number of samples, and can be adjusted and optimized as needed, making it suitable for biological separation and purification work of various scales.

The global Continuous Flow Ultracentrifuge System market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
