## Abstracts

The global Continuous Heat Treatment Machine market size is predicted to grow from US$ 354 million in 2025 to US$ 480 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

In 2024, the global production of continuous heat treatment machines reached 41,554 units, with an average selling price of US$8,342 per unit.

A continuous heat treatment machine is a specialized piece of equipment that performs heat treatment on metallic or non-metallic materials through a continuous and automated process. Its core feature is that the material flows continuously through controlled zones for heating, holding, and cooling, enabling continuous operation of the heat treatment process. This equipment typically integrates systems for temperature gradient control, atmosphere conditioning (such as inert protection and reducing atmospheres), and conveyor speed matching. By precisely controlling parameters such as heating rate, holding time, and cooling rate, it completes heat treatment processes such as annealing, normalizing, quenching, tempering, and age hardening. The aim is to improve the microstructure and mechanical properties (such as hardness, toughness, and wear resistance) of materials, while meeting the production requirements of large-volume, high-efficiency, and uniform processing. It is widely used in industries such as steel, non-ferrous metals, machinery manufacturing, and automotive parts.

The gross profit margin of continuous heat treatment machines is 17.19%, with a gross profit of US$1433.99. Single-line capacity is 1700-1800 units/year.

The upstream of continuous heat treatment machines consists of heat treatment raw materials and core components (steel/copper, insulation materials, electromechanical

parts, control components, heating devices), represented by companies such as Shougang, Hebei Iron & Steel, Luyang Energy Saving, Huichuang Technology, Dayang Electric, and international companies like Lincoln Electric and ESAB. Downstream applications include automotive manufacturing (body welding/parts processing), aerospace (material heat treatment), mechanical engineering (tool steel/structural component treatment), new energy (wind turbine blades/photovoltaic equipment), rail transportation (wheel/axle heat treatment), and petrochemicals (pipeline/valve heat treatment), involving companies in the automotive, machinery, energy, and aerospace industries.

The potential business opportunities for continuous heat treatment machines focus on four main areas: import substitution of high-end equipment (such as vacuum furnaces and RTP equipment with significant application potential in the semiconductor and aerospace fields); demand growth in emerging fields (covering specific scenarios such as lithium batteries/hydrogen energy in the new energy field, waste tire pyrolysis/sludge treatment in the environmental protection field, and titanium alloy implants in medical devices); technology upgrade services (including intelligent transformation such as AI temperature control/remote operation and maintenance, and supporting needs for environmental protection technologies such as waste gas treatment/water recycling); and service model innovation (reducing the initial investment threshold for customers through value-added services such as equipment leasing, process outsourcing, and remote diagnostics).
