Continuous monitoring system services refer to an integrated service model that combines sensor networks, data acquisition terminals, and cloud platforms to conduct all-weather, real-time, and continuous data monitoring and analysis of specific objects or environments, and provides supporting services such as remote operation and maintenance, data interpretation, and early warning management. This service is widely used in fields such as medical and health monitoring, industrial equipment operating status monitoring, environmental quality monitoring, and energy facility safety management. Its core value lies in reducing the frequency of manual inspections, improving the efficiency of anomaly detection, and achieving predictive maintenance through data modeling. The system typically consists of front-end sensing devices, communication modules, a data platform, and an algorithm analysis system, and is commercialized through subscription models or long-term operation and maintenance contracts. With the maturity of IoT technology, the decrease in cloud computing costs, and the increasing demands for safety compliance and refined management across industries, continuous monitoring system services are upgrading from simple data collection to intelligent analysis and decision support, with a steadily expanding market size. In the future, it will play an even more critical infrastructure role in smart cities, telemedicine, and industrial digital transformation.
