The Finger Joint Continuous Passive Mobility Instrument is mainly used to assist patients with hand movement dysfunction caused by stroke, brain trauma, spinal injury, and peripheral nerve damage to perform repeated motor function rehabilitation training in the community or at home. The robot system extracts the patient's active movement intention by detecting multi-channel surface electromyography signals of the affected hand, and combines the data measured by angle and force sensors to obtain the status of the affected limb. On this basis, the robot uses an intelligent control algorithm to assist the affected hand in movement through pneumatic muscle contraction.

Rehabilitation. This rehabilitation robot has multiple degrees of freedom, assists the patient's hand in performing multi-joint compound movements, and fuses multi-sensor data information during the rehabilitation process for rehabilitation effect evaluation. It also improves the patient's initiative by using the rehabilitation treatment virtual environment on the computer. Sex and training interests. The utility model has a simple structure, flexible movement, safety and reliability, can realize rehabilitation training of the movement function of the affected hand, conforms to the physiological structural characteristics of the human hand, and is more comfortable to wear.
