The research report highlights the growth potential of the global Continuous Subcutaneous Insulin Infusion (CSII) Pump market. Continuous Subcutaneous Insulin Infusion (CSII) Pump are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Continuous Subcutaneous Insulin Infusion (CSII) Pump. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Continuous Subcutaneous Insulin Infusion (CSII) Pump market.

Insulin pump is an effective means of blood sugar management for diabetic patients. It is a micro-precise, continuously controllable subcutaneous insulin injection tool that can better simulate the physiological insulin secretion pattern. Obtaining the basis for adjusting the dose of insulin pump therapy through blood glucose monitoring is particularly important for diabetic patients characterized by endogenous insulin deficiency. The continuous glucose monitoring (CGM) system can facilitate continuous monitoring of blood glucose and thereby adjust the infusion dosage of the insulin pump.

Compared to a syringe or pen, an insulin pump provides a smooth and continuous infusion to maintain blood sugar stability throughout the day. CGM and insulin pump are two very important technologies in the diagnosis and treatment of diabetes today. They are often used together in clinical practice, called CGM&CSII therapy. The development of 'double C' technology promotes the advancement of diabetes diagnosis and treatment technology.
