The Controllable Point Pipeline Repair System (CPPRS) is a trenchless technology solution for repairing localized defects in underground pipelines. It precisely locates pipeline damage points (such as cracks, leaks, and misaligned joints) and delivers prefabricated repair materials (such as fiberglass reinforcement sheets, UV-curable sleeves, or heat-curable patches) to the target location via a robotic or airbag system. Under control, the system then applies pressure, heat, or light to cure the material at the targeted location, completing the local structural reinforcement and sealing repair. This system boasts a short construction cycle, minimal disruption, high positioning accuracy, and strong adaptability, making it widely used in urban drainage, industrial pipelines, and petrochemical pipelines. Compared to traditional full-section lining repairs, the CPPRS emphasizes "precise intervention," enabling localized repairs without disrupting overall pipeline network operations. It is particularly suitable for isolated defects or early-stage defects discovered during pipeline operation.
