The global Cooking Oil Pump market size is predicted to grow from US\$ 308 million in 2025 to US\$ 409 million in 2032; it is expected to grow at a CAGR of 4.1% from 2026 to 2032.

In 2025, global edible oil pump production reached approximately 699 k units, the average price is 450 usd/unit. Edible oil pump is an industrial-grade fluid equipment specially used for conveying, metering or circulating edible oil. It is essentially a food-contact oil-resistant power source. It must strictly comply with food safety regulations and ensure that chemical contamination, oxidation or mechanical shear denaturation of the oil does not occur during transportation.

Market Concentration and Key Players:

Internationally, the market concentration of edible oil pump is relatively high, mainly concentrated in Europe and the United States and other developed countries. For example, large manufacturers such as Castle Pumps and Frontline International; from the domestic point of view, there is still a lot of room for development of edible oil pumps.

Manufacturing Processes and Market Trends:

Edible oil pump manufacturing is the combination of food grade clean and precision fluid engineering, the core of the process is to achieve absolute inertia and no residue in contact with grease parts. Manufacturing starts with precision casting and CNC turning of 316L or 304 stainless steel, all runner surfaces are passivated and polished to ensure roughness below Ra 0.8 microns to prevent grease adhesion and bacterial growth. Critical positive displacement rotors (e.g., gears, cams) are hardened and ground, and clearances are strictly controlled during assembly to avoid shearing and heating of

grease while efficiently conveying. The sealing link adopts multi-channel food-grade PTFE or fluororubber sealing rings, and through the cyclic pressure test of high-temperature grease, the long-term sealing performance under the working condition of frying oil is ensured. Complete material traceability verification and food contact compliance documentation is required after the complete pump is assembled in the clean room.

The market is accelerating its evolution towards intelligent and multifunctional integration. The traditional delivery pump is being replaced by the integrated module of 'pump + metering + filtration + heating.' By integrating the flowmeter and temperature sensor, the automatic supply, circulation and waste control of oil in the frying production line can be realized. With the emphasis on oil quality management in food factories, intelligent pumps with online viscosity monitoring and oxidation warning functions are becoming popular. The built-in microprocessor can automatically adjust pump speed or trigger oil change reminder according to oil index. In terms of hygienic design, the CIP (Clean In Place) structure with no dead space and quick disassembly and cleaning is becoming standard on high-end pumps to meet the stringent audit requirements of EU and US food and drug regulations.
