A cooling system pump, also known as a coolant pump or water pump, is a device used in an engine's cooling system to circulate coolant throughout the engine and radiator. It is typically driven by a belt connected to the engine's crankshaft or by an electric motor.

The main function of the cooling system pump is to circulate coolant, which absorbs heat from the engine, to the radiator where it is cooled before being recirculated back to the engine. This helps to regulate the engine's temperature and prevent overheating.

The pump consists of an impeller, which is a rotating component that creates the flow of coolant, and a housing that contains the impeller and directs the flow of coolant. The impeller is typically made of metal or plastic and is designed to efficiently move coolant through the system.

Cooling system pumps can vary in design depending on the specific engine and cooling system configuration. Some pumps are driven by a belt connected to the engine's crankshaft, while others are electrically driven. Electric pumps are commonly used in hybrid and electric vehicles, as well as in some high-performance vehicles.

United States market for Cooling System Pump is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
