The global Cooling Tower Water Treatment Chemical market size is predicted to grow from US\$ 2958 million in 2025 to US\$ 3946 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Cooling Tower Water Treatment Chemicals refer to a class of water treatment chemicals utilized in cooling towers and open-loop circulating cooling water systems. Primarily through mechanisms such as scale inhibition, corrosion inhibition, microbial and algal control, dispersion, cleaning, pre-filming, and pH adjustment, these agents manage issues including scaling, corrosion, microbial proliferation, algal growth, slime formation, and sedimentation that arise during the circulation, evaporation, concentration, and heat exchange processes of the cooling water. Consequently, they serve to maintain heat exchange efficiency, mitigate the risks of equipment corrosion and clogging, and extend the operational lifespan of cooling towers, heat exchangers, piping, and the entire circulating water system.

The cooling tower water treatment chemicals industry constitutes a sub-segment characterized by stable overall growth. Demand is primarily driven by the continuous operation of industrial facilities, as well as the increasingly stringent requirements of high-load cooling systems such as central air conditioning and data centers regarding heat exchange efficiency, water conservation, energy reduction, and operational safety. As sectors such as power generation, petrochemicals, steel, chemicals, electronics manufacturing, and data centers become increasingly reliant on cooling water systems, issues arising during cooling tower operation including scaling, corrosion, microbial proliferation, slime accumulation, and the risk of *Legionella* contamination directly impact heat exchange efficiency, energy consumption, and downtime costs; consequently, there remains a persistent, inelastic demand for cooling tower water

treatment chemicals.
