The global Cooling Vapor Chamber market size is predicted to grow from US$ 1065 million in 2025 to US$ 2738 million in 2032; it is expected to grow at a CAGR of 14.7% from 2026 to 2032.

A cooling vapor chamber (also known as a vapor-chamber cooler) is a heat-dissipation device used for cooling high-performance electronic components, such as CPUs in computers. It is a type of heat sink that uses a phase-change process to transfer heat away from the electronic component.

The vapor chamber works by using a sealed chamber that contains a small amount of liquid. When the liquid is heated, it turns into a vapor and rises to the top of the chamber. As the vapor condenses, it releases heat, which is then carried away by a heat sink and dissipated into the environment. The process is continuous, and the vapor chamber can provide efficient cooling for high-power electronic devices.

The growth of the thermal vapor chamber market is mainly driven by the continuous improvement of the performance of electronic equipment and the increasingly prominent heat dissipation issues. As the performance of laptops, smartphones, servers and other equipment continues to improve, the demand for heat dissipation is also growing, and vapor chambers have become an important cooling solution. In addition, with the strengthening of the trend of green environmental protection, vapor chamber manufacturers are constantly developing environmentally friendly materials, improving production processes, and reducing energy consumption and emissions, which also provides new development opportunities for the vapor chamber market.
