The copper foil materials for FPC are mainly divided into two types: rolled copper and electrolytic copper. It is a conductor layer bonded to the insulating material of the cover film, and is etched into the required pattern after various processes. Electrolytic copper foil is deposited on a bright stainless steel roll by an acid copper plating solution to form a uniform copper film, which is obtained by continuous stripping and winding; calendered copper foil is obtained by using copper ingots or copper blocks of a certain thickness. Repeated rolling and annealing process to form the required thickness of copper foil.
