The global Copper Gold Powder market size is predicted to grow from US\$ 649 million in 2025 to US\$ 877 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Copper-gold powder is an alloy powder composed of metallic elements such as copper and zinc. After special processing, it exhibits a flaky structure and metallic luster. Copper-gold powder is primarily composed of copper and zinc, sometimes containing other metallic elements. It is produced as a flaky powder through processes such as smelting, atomization, ball milling, and grading. Upstream production relies heavily on the supply of non-ferrous metal raw materials such as electrolytic copper and zinc ingots. Fluctuations in raw material costs directly impact midstream production. Downstream applications are extensive, with copper-gold powder widely used in the manufacture of coatings, printing inks, plastics, decorative materials, and even special conductive functional materials.

Global sales volume in 2024 was approximately 65,000 tons, with an average market price of approximately US\$10,000 per ton. The scale of single-line production capacity varies depending on the production process and investment scale of production equipment, and the industry gross profit margin ranges from 12% to 27%.

With increasing global environmental protection requirements, water-based, environmentally friendly, and highly weather-resistant coated copper-gold powders will become the focus of technological innovation and market competition. Meanwhile, specialty copper-gold powders for emerging functional fields such as 3C electronics and

conductive pastes will also provide new growth points. However, some domestically produced copper-gold powders lag behind international advanced levels in product quality, exhibiting issues such as large particle size variations, an excessive proportion of fine particles, and thicker metal flakes. Furthermore, in specific applications, especially when printing on highly absorbent paper (such as coated paper), issues such as poor print adhesion and easy powder detachment can easily occur, undoubtedly placing higher demands on production processes and control.
