Abstracts

The global Copper Pillar Bumping market size is predicted to grow from US$ 1635 million in 2025 to US$ 2784 million in 2031; it is expected to grow at a CAGR of 9.3% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Copper pillars are terminals used to “flip-chip” IC chips to a substrate in a semiconductor package by TCFC (Thermal Compression Flip-Chip) technology. Copper pillars are formed on aluminum electrode pads of an IC chip. Copper pillar interconnects are seeing higher demand due to an increase in pin count with fine pad pitches integrated on an IC chip. Copper pillars with dimensional uniformity can be formed on a silicon wafer by using fine plating pattern forming technology.

Driven by the exponential growth of AI, high-performance computing (HPC), 5G, and advanced mobile SoCs, CPB technology is becoming the de facto standard in fine-pitch interconnects. Its advantages in achieving higher I/O density, lower z-height, and improved signal integrity make it critical for next-generation chiplets, heterogenous integration, and fan-out architectures. Emerging trends include sub-20 ?m pitch micro-bumping, lead-free CPB solutions, and integration with RDL and redistribution layer (RDL)-first fan-out processes.
