Copper plating electrolyte and additives are two important components of the electroplating process used for depositing a layer of copper on the object's surface.

Copper plating electrolyte is a solution that contains dissolved copper ions and other chemicals used in the electroplating process. The copper ions in the electrolyte are attracted to the negatively charged object being plated (the cathode), resulting in a layer of copper coating on the surface of the object. The composition of the electrolyte can affect the quality, thickness, and adhesion of the plated copper layer, as well as the overall efficiency of the electroplating process.

Additives are chemical compounds that are added to the copper plating electrolyte to achieve specific effects. Different types of additives can be used to modify the properties of the plated copper layer, such as enhancing its brightness, ductility, corrosion resistance, or leveling performance. Commonly used additives in copper electroplating include brighteners, leveling agents, accelerators, and suppressors. They are typically added in small quantities to the plating solution and are carefully controlled to achieve the desired results.

Global 5 largest manufacturers of Copper Plating Electrolyte and Additives are Umicore, Element Solutions (MacDermid Enthone), MKS (Atotech), Tama Chemicals (Moses Lake Industries) and BASF, which make up over 74%.
