The global Core Cutting Machine market size is predicted to grow from US\$ 48.91 million in 2025 to US\$ 66.65 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Core cutting machines are specialized equipment used in the geological exploration and mining industries to cut, trim, and process core samples extracted during drilling operations. This equipment is crucial in delivering rock, soil, or mineral samples to laboratories for analysis, helping to determine properties such as the material's strength, composition, and structure. The cutting process must ensure minimal damage and precise dimensional control to maintain the integrity of the core sample. The upstream of the core cutting machine industry chain includes key components such as cutting blades, high-precision motors, hydraulic systems, control units, and frames; the midstream involves manufacturers integrating these components into complete machines, optimizing cutting accuracy, sample handling, and operational safety; downstream applications include mining companies, geological survey institutions, and research laboratories that require processed core samples for analysis. Installation, commissioning, maintenance, calibration, and sample testing services are also provided to ensure optimal performance and sample integrity. In 2025, global core cutting machine production was approximately 2,500 units, with a global average market price of approximately US\$20,000 per unit. The gross profit margin of major companies in the industry was between 30% and 45%. Global production capacity in 2025 was approximately 3,500 units.

United States market for Core Cutting Machine is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
