Corn wet-milling is a method of refining corns to produce end products consumed by millions of people worldwide. Shelled corn is processed in two ways: dry mills or wet mills. Corn is divided into four components during the wet-milling process: starch, fibre, germ, and gluten. Cleaning, steeping, milling & germ separation, fine grinding & screening, and starch & gluten separation are all part of the corn wet-milling process.

Conversion of starch to syrup and dextrose fermentation add value to products such as ethanol, amino acids, and polylactic acid, which are employed in biodegradable products.
