A corneal bandage lens, also known as a therapeutic or therapeutic contact lens, is a type of soft or rigid contact lens used as a medical device to protect and aid in the healing of the cornea, the clear front surface of the eye. These lenses are specially designed to provide comfort, reduce pain, and promote healing for various corneal conditions, injuries, or after certain eye surgeries.

Corneal bandage lenses are used to protect the cornea, particularly when it is injured, has undergone surgery, or is affected by conditions like corneal abrasions, ulcers, or erosions. The lens helps reduce pain and discomfort associated with corneal injuries by acting as a protective barrier between the eye's surface and the eyelids. By providing a protective covering and promoting a conducive environment for healing, the corneal

bandage lens supports the natural healing process of the cornea.

Corneal bandage lenses are used in cases of corneal disorders, such as bullous keratopathy, corneal dystrophies, or corneal hydrops. They are also applied in the management of traumatic corneal injuries. After certain eye surgeries, like corneal transplantation or refractive surgery (e.g., LASIK), corneal bandage lenses are used to aid in the healing process and minimize discomfort.
