Corrugated Pipe Expansion Joint is a mechanical device used in piping systems. It is typically made of a flexible, corrugated material such as metal (e.g., stainless steel, carbon steel) or synthetic rubber. The corrugated structure allows the joint to absorb axial, lateral, or angular movements caused by factors like thermal expansion and contraction of the pipeline, vibration, or settlement of the supporting structures. This helps to relieve stress on the pipeline and its connected components, preventing damage such as pipe breakage, leakage, or loosening of joints, and ensuring the safe and continuous operation of the piping system
