The report requires updating with new data and is sent in 48 hours after order is placed.

Counter flow cooling tower refers to the cooling tower in which the air moves in the direction opposite to the falling direction. The cooling water is pumped into the process flow from the cooling tower pool. The cooled cooling water is heated by the process, its temperature rises, and then the warm cooling water pump is returned to the cooling tower for cooling. Because the countercurrent maintains a slowly decreasing difference or gradient, the maximum heat or mass transfer that can be obtained by countercurrent is higher than that of cocurrent exchange.
