A counter IC is a type of digital integrated circuit that takes a pulse signal as input, automatically increments or decrements the number of pulses through internal flip-flops or logic circuits, and outputs the corresponding count value. Its main function is to count the input pulse signal and output the result in digital or logic signal form.

Upstream raw materials for counter ICs include single-crystal silicon, silicon wafers, photoresist, etching solution, doping sources, plastic packaging, ceramic packaging, and lead frames. Midstream core processes include IC design, wafer manufacturing, packaging, and testing. Downstream applications are mainly in consumer electronics, industrial control, communication equipment, and instrumentation.

In 2025, global counter ICs sales reached 4.05 billion units, with a production capacity of approximately 5.05 billion units, an average selling price of US\$1.25 per unit, and an average gross margin of 25%-35%.
