Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

In addition to the genetic information carried by DNA/RNA, the protein envelope of the virus also carries a lot of information about the structure and pathogenesis of the virus, which can also determine whether the patient is infected with the virus and has immunity to the virus. Nucleic acid detection relies on primers, and detection of viral proteins mainly relies on antibodies. As long as the antibody with high enough affinity and good enough specificity is found, the tedious steps of extracting viral RNA can be eliminated, and the serum or sputum of patients at the onset of the disease can be directly used for protein immunoassay (ELISA), and the results can be obtained within 3-5 hours.

According to this study, the global COVID-19 Rapid Test market size will reach US\$ million by 2029.
