Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

RNA vaccines are leading the way in vaccines because they are particularly well suited to rapid development. Although no RNA vaccine has yet been approved, the threat of a pandemic is a great incentive to accelerate its progress. RNA vaccines consist of mRNA strands. They are injected into the body, usually wrapped in lipid nanoparticles. They fuse with cells. Once inside the cell, the RNA sequence is translated by the ribosome into a protein or part of a protein.

According to this study, the global COVID-19 RNA Vaccine market size will reach US\$ million by 2029.
