A cow burping inhibitor is a substance or feed additive designed to reduce methane emissions produced by cows during digestion, particularly from enteric fermentation in the stomach, which is released primarily through burping. These inhibitors target the methanogenic microbes in the cow's rumen to suppress methane production without harming the animal or affecting milk and meat quality. Common examples include compounds like 3-NOP (3-nitrooxypropanol) or natural additives like seaweed. By reducing methane, a potent greenhouse gas, cow burping inhibitors play a key role in making livestock farming more climate-friendly.
