The global COX-2 Selective NSAIDs market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Nonsteroidal anti-inflammatory drugs (NSAIDs) have analgesic, antipyretic and anti-inflammatory effects, but can also cause a series of adverse reactions. Their mechanism of action is mainly to inhibit cyclooxygenase [cyclooxygenase, COX; also known as prostaglandin synthase (PGHS)], preventing the conversion of arachidonic acid into various prostaglandins, prostacyclins and thromboxanes. COX has two isoenzymes, COX-1 and COX-2, and there are significant differences in the regulation and expression of the two in different tissues. Various NSAIDs have different enzyme inhibition abilities, which can affect their activity and toxicity at the same time. Before the discovery of the COX-2 isoenzyme in the early 1990s, most NSAIDs could effectively inhibit both COXs. However, researchers later developed NSAIDs that can preferentially inhibit COX-2 while retaining the activity of COX-1. COX-2 is in the inflammatory mediators and participates in the production of inflammatory mediators, while COX-1 has an important gastric cell protective effect. The new drugs are called COX-2 selective NSAIDs (COXIBs), also known as COX-2 inhibitors and COX-2 selective inhibitors.

United States market for COX-2 Selective NSAIDs is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
