The crane end beam is a structural component of an overhead crane that connects the crane bridge to the trolley and crane. It is typically made of steel and is designed to support the weight of the crane and any load being lifted. The crane end beam is a key component of the crane system because it provides the necessary structural support for safe and efficient operation. It is typically installed on rails or runway beams to allow the crane to move along a fixed path. The design of the crane end beam depends on the specific requirements of the crane system, including the weight and size of the lifted load, the operating environment, and the type of crane and trolley used.
