A craniomaxillary fixation system is a medical device used to stabilize and align the skull and maxillofacial bones after trauma or surgery. It includes plates, screws, and fixation tools, providing rigid support, promoting bone healing, and restoring facial structure and function. These systems are widely used in oral and maxillofacial surgery, trauma reconstruction, and craniofacial procedures. The upstream of the industry chain includes suppliers of medical-grade metals, polymer materials, and precision instruments; the midstream involves assembly, sterilization, and quality testing; and the downstream primarily consists of hospitals, surgical centers, and specialist clinics, along with supporting installation, surgical training, and postoperative maintenance services. In 2024, the global production of craniomaxillary fixation systems was approximately 81,000 units, with an average market price of approximately US\$2,450 per unit. Gross profit margins typically range from 35% to 55%, depending on material quality and manufacturing precision. Global production capacity in 2024 was approximately 108,000 units.
