The critical conduction mode power factor correction controller is a power control chip used to control the operation of the critical conduction mode power factor correction

circuit. CCM PFC controllers usually integrate functional modules such as PWM (pulse width modulation) control circuit, current sampling circuit, feedback circuit and protection circuit for controlling power switching devices (such as MOSFETs). Its main working principle is to calculate the power factor of the power supply by measuring the current and voltage signals of the input AC power supply, and control the conduction time and conduction interval time of the power switching device according to the set reference value and control algorithm, so that Realize the control of the current waveform of the AC power supply and the correction of the power factor. Under the control of the CCM PFC controller, the power switching device can be turned on and off in an appropriate way, so as to ensure that the waveform of the AC power supply current meets the preset requirements, so that the DC voltage output by the power supply is stable, the ripple is small, and the power factor is high. In addition, the CCM PFC controller can also have a variety of protection functions, such as input voltage over/under protection, over-current protection, over-temperature protection, etc., to ensure the safety and stability of the power supply. CCM PFC controllers are widely used in various power electronic devices, such as TVs, computers, mobile phone chargers, LED lights, industrial power supplies, etc., to improve their power factor and power utilization, reduce energy waste and harmonic pollution, and at the same time Improve the stability and reliability of the power supply.
