Some mineral raw material is labeled “critical” when the risks for supply shortage and their impacts on the economy are higher compared with most of the other raw materials. Two types of risks are considered: a) the 'supply risk' taking into account the political-economic stability of the producing countries, the level of concentration of production, the potential for substitution and the recycling rate; and b) the 'environmental country risk' assessing the risks that measures might be taken by countries with weak environmental performance in order to protect the environment.
