Crop growth regulators are agrochemicals that influence the development of plants which are required at very low concentrations. There are natural regulators, which are produced by the plant itself, and also synthetic regulators; those found naturally in plants are called phytohormones or plant hormones.

Globally, the quality of soil is declining due to various reasons such as overgrazing, agricultural activities, deforestation, overexploitation of land to produce fuel wood, and industrialization. Crop growth regulators influence the growth and differentiation of plant cells, tissues, and organs. They promote the fast growth of plants, no matter if they are fruits & vegetables, cereals & grains, or oilseeds & pulses, which indirectly helps in meeting the rising consumer demand for various types of food products. Hence, this one critical factor helps drive the demand for crop growth regulators.
