A cross flow tray is a separation device commonly used in process plants, especially in distillation towers. In this type of tray, liquid flows sideways across the tray and then into a vertical downcomer. Meanwhile, vapor passes upward through holes or passages in the tray and across the flow of liquid. This design allows for efficient vapor - liquid mass transfer, which is crucial for the separation process. As the liquid travels across the tray, it forms a liquid layer, and the vapor bubbles through this layer, promoting the exchange of components between the vapor and liquid phases. The cross - flow tray is widely used in various industrial applications, such as distillation, absorption, and stripping, due to its relatively wide operating range and high separation efficiency.
